

Triage Report: Demo1

Date: 2026-01-30 07:19:51

1. Executive Landscape

Technology Mix: CORE: 1, LAYOUT: 1
Detected Paradigm: ETL

Summary: The repository contains a single SSIS package (DimCustomers.dtsx) that orchestrates an ETL process to extract customer data from the Sales.Customers table and load it into the DimCustomer destination. The control flow consists of an Execute SQL Task ('max customer') followed by a Data Flow Task ('DimCustomer'), indicating a sequential dependency. The data flow is straightforward, mapping source columns to destination columns with basic error outputs. No external configuration or support files are present, and the process is self-contained.

2. Architectural Flow Visualization

Visual representation of the discovered migration mechanism

3. Observations & Strategic Risks

[CRITICAL] Identified Gaps (Missing Assets):

- No documentation or configuration files found to clarify parameterization or environment setup.
- No explicit mapping for error outputs beyond default SSIS behavior.

Technical Observations:

- No support or configuration files detected; the package is self-contained.
- The data flow is a direct mapping with no complex transformations or lookups.
- No script tasks or custom components present, reducing migration complexity.

Critical Clarifications Required:

- ? Is the parameter for 'custid' in the source query dynamically set by the 'max customer' Execute SQL Task, or is it static?
- ? Are there any external configuration files or environment dependencies not present in the repository?
- ? Should error outputs (ErrorCode, ErrorColumn) be mapped to a specific error handling process in the target platform?

3. CRUD Cross-Reference Matrix

Consolidated view of database IO and asset interactions.

No explicit table IO detected for matrix generation.

4. Detailed Component Analysis

Asset: *DimCustomers.dtsx*

Purpose: Extracts customer data from Sales.Customers and loads it into DimCustomer using a sequential control flow.

Complexity: LOW | **Estimated Effort:** S (Small)

Source Inputs: Sales.Customers (OLE DB Source), Parameter for custid (WHERE custid > ?)

Target Outputs: DimCustomer (OLE DB Destination)

Logic Flow:

- Step 1: Execute SQL Task ('max customer') to retrieve or set max customer id.
- Step 2: Data Flow Task ('DimCustomer') reads from Sales.Customers and writes to DimCustomer.
